**Problem.** Find all real polynomials  $P(x)$  with  $P(0) = 0$  such that there exists a function  $F(x)$  satisfying  $F(x) > x$  for all  $x \geq 0$  and

$$F(P(x)) = P(F(x)) \quad \forall x \in \mathbb{R}.$$

*Solution.* Plugging  $x = 0$  gives

$$P(F(0)) = F(0).$$

Composing  $F$  on both sides, we get

$$P(F^2(0)) = F(P(F(0))) = F^2(0).$$

Similarly,

$$P(F^n(0)) = F^n(0) \implies P(F^{n+1}(0)) = F(P(F^n(0))) = F^{n+1}(0).$$

Therefore,

$$P(F^n(0)) = F^n(0) \quad \forall n \in \mathbb{N}.$$

Let  $Q(x) = P(x) - x$ . Clearly  $Q(x)$  is a real polynomial.

As  $F(0) > 0$  and  $F(x) > x$ , we get

$$F(0) > 0 \implies F^2(0) > F(0) \implies \dots \implies F^n(0) > F^{n-1}(0).$$

Hence,  $\{F^n(0)\}_{n \geq 1}$  is a strictly increasing sequence. Therefore,

$$Q(F^n(0)) = 0 \quad \forall n \in \mathbb{N},$$

and since there are infinitely many zeroes of  $Q$ , this forces  $Q \equiv 0$  which implies  $P \equiv x$ . For  $P(x) = x$ , we can pick  $F(x) = x + 1$ , which clearly satisfies both conditions. ■
