**Problem.** Let  $f: [0, 1] \rightarrow \mathbb{R}$  be a function which is  $n + 1$  times differentiable and satisfies

$$f(1) = f(0) = f'(0) = \cdots = f^{(n)}(0) = 0.$$

Prove that there exists  $\varepsilon \in (0, 1)$  such that  $f^{(n+1)}(\varepsilon) = 0$ .

*Solution.* As  $f(1) = f(0) = 0$ , by LMVT we get  $\varepsilon_1 \in (0, 1)$  such that  $f'(\varepsilon_1) = 0$ . Now as  $f'(\varepsilon_1) = f'(0) = 0$ , again by LMVT we get  $\varepsilon_2 \in (0, \varepsilon_1)$  such that  $f''(\varepsilon_2) = 0$ . Suppose we have  $\varepsilon_k \in (0, 1)$  with  $k \leq n$  such that  $f^{(k)}(\varepsilon_k) = 0$ . Now, as  $f^{(k)}(x)$  is differentiable, by LMVT, we get  $\varepsilon_{k+1} \in (0, \varepsilon_k)$  such that  $f^{(k+1)}(\varepsilon_{k+1}) = 0$ . Continuing as above, we get  $\varepsilon_{n+1}$  such that  $f^{(n+1)}(\varepsilon_{n+1}) = 0$ , as desired. ■
