**Problem.** Let  $f: [a, b] \rightarrow [a, b]$  be a differentiable function. Consider a point  $(\alpha, \beta)$  on the line joining  $(a, f(a))$  and  $(b, f(b))$  such that  $\alpha \notin [a, b]$ . Prove that there exists a tangent to the curve passing through  $(\alpha, \beta)$ .

*Solution.* Define

$$g(x) = \frac{f(x) - \beta}{x - \alpha}.$$

Clearly  $g(x)$  is differentiable. Then note that

$$g(a) = \frac{f(a) - \beta}{a - \alpha} \quad \text{and} \quad g(b) = \frac{f(b) - \beta}{b - \alpha}.$$

Since the points  $(a, f(a))$ ,  $(b, f(b))$ , and  $(\alpha, \beta)$  lie on a straight line, the slope of line joining  $(a, f(a))$  and  $(\alpha, \beta)$  is equal to that of  $(b, f(b))$  and  $(\alpha, \beta)$ . Therefore, we have  $g(a) = g(b)$ . So by LMVT on  $(a, b)$ , we get  $c \in (a, b)$  such that

$$g'(c) = \frac{g(b) - g(a)}{b - a} = 0.$$

Note

$$g'(x) = \frac{f'(x)(x - \alpha) - (f(x) - \beta)}{(x - \alpha)^2}.$$

Therefore

$$g'(c) = 0 \implies f'(c)(c - \alpha) = f(c) - \beta \implies f'(c) = \frac{f(c) - \beta}{c - \alpha}.$$

Choosing  $c$  as our point on the curve through which the tangent passes, we are done. ■
